Operation and Service

Innovation of the coin acceptor

The changing circulation of coin in an economy brings new demands for quick and reliable coin depositing mechanisms. Added to this is the growing problem of more realistic counterfeit coins. Existing technologies are simply not good enough today to out-sort all foreign coins / objects and counterfeits.

Reis Eurosystems through new technologies in this area provided a major step forward.

The 3 level coin cleaning device easily separates out any foreign object before the coins enter into the machine. The new, extremely fast, horizontal coin feed mechanism, as used on professional cash centre high-speed coin sorters, ensures a reliable transportation of the coin inside the Nummus.

The newly developed coin sensor can recognise foreign or counterfeit coins to 99.9% accuracy as it is not optically based and therefore not subject to interference from dirt.

Standardwerk Eugen Reis GmbH & Co. KG
